Create and Manage Tenants and Domains

At the end of this episode, I will be able to:

1. Create a tenant
2. Implement and manage domains
3. Configure organizational settings, including security, privacy, and profile

Learner Objective: *Implement the creation and management of tenants and domains inside Microsoft 365.*

Description: In this episode, you will learn all about creating and managing tenants and domains in Microsoft 365. You will also learn to configure organizational settings, including security, privacy, and profile settings.

- The "tenant" represents the resources associated with your organization
- The tenant is stored in Europe or North America
- The tenant includes a single Azure Active Directory instance
- You can also have a tenant with multiple geographical locations and move your tenant from one location to another
- With Microsoft 365 Multi-Geo, your organization can expand its Microsoft 365 presence to multiple geographic regions and/or countries within your existing tenant.
- For multiple Microsoft 365 tenants (not ideal), the following exist:

    - Inter-tenant collaboration
    - Cross-tenant mailbox migration
    - Tenant-to-tenant migration

- To add, modify, or remove domains, you must be a Domain Name Administrator or Global Administrator
- You can now add up to 5 onmicrosoft domain names. You can designate one as the fallback default.
